

Phuong Tran

Full-stack Developer

Phone: +84 39 250 2010

Email: nhatphuongb1@gmail.com

GitHub: github.com/phuongfullstack

Education: Duy Tan University — Bachelor of Software Engineering

PROFESSIONAL SUMMARY

Senior Full-stack Developer with 8+ years building and shipping production-grade web and desktop applications across healthcare, fintech, education, and SaaS — frequently owning systems end-to-end, from cloud infrastructure and architecture through backend, frontend, and DevOps delivery.

Deep backend expertise in .NET, applying clean / layered / hexagonal architecture, dependency injection, and well-tested, maintainable code. Comfortable across the full stack (Angular, Vue, React) and cloud-native delivery on Azure and AWS — with hands-on CI/CD, infrastructure-as-code, structured observability (Serilog, distributed tracing), and OAuth2/OIDC security.

Proven technical leader who owns architecture decisions, sets coding standards, and mentors engineers. Combines a strong desktop background (WPF, WinForms, UWP, ElectronJs) with modern web delivery and AI-assisted development to ship reliable software at pace.

SKILLS

- **Languages:** C#, JavaScript / TypeScript, SQL, Python (scripting).
- **Backend:** .NET Core, .NET Framework, ASP.NET Web API, Entity Framework, SignalR, WebSocket, gRPC.
- **Frontend:** Angular, VueJS 3, Svelte, React, VanillaJS, HTML, CSS, Material Design, Bootstrap, Kendo UI.
- **Mobile & Desktop:** WPF, WinForms, UWP, Electron.js, Flutter, Android.
- **Testing & Quality:** NUnit, xUnit, Moq, Jest, Jasmine, JUnit, Mockito; Playwright (E2E), k6 (load/performance); Codacy, Codecov.
- **Data:** SQL Server, PostgreSQL, MySQL, MongoDB, CosmosDB, Redis, Firebase, OrientDB.
- **Cloud & Messaging:** Azure (App Service, Functions, Service Bus, Application Insights), AWS (S3, SQS, SNS, CloudFront, Beanstalk), GCP / Firebase; messaging with RabbitMQ, MSMQ, Azure Service Bus.
- **DevOps & Architecture:** Git, Docker, CI/CD, GitHub Actions, Azure DevOps, Terraform, Bicep, NuGet; Microservices, Clean / Hexagonal Architecture, DDD, Serverless, Containerization.
- **AI-Assisted Dev (Vibe Coding):** GitHub Copilot, Cursor, Claude, Windsurf.
- **English:** Upper Intermediate (B2).

PROJECT HISTORY

Project Name	AI-Driven Enterprise Quotation & Procurement Platform
Duration	6/2025 – Present
Description	An enterprise-grade procurement platform delivered for a Japanese engineering and construction client, standardizing and automating the full procurement lifecycle — from quotation and contract management to vendor analytics — with AI-driven cost forecasting, real-time order tracking, and KPI dashboards. As the architect engineer, owned the platform end-to-end: infrastructure, full-stack development, DevOps, quality engineering, and multi-environment delivery.
Position	Architect Engineer (Full-stack & DevOps)
Responsibility	• Infrastructure & Architecture: Architected the cloud infrastructure on Azure using Terraform (infrastructure-as-code), bootstrapped the codebase from scratch, and defined the system architecture, coding standards, and clean layered

	design (separation of concerns, dependency injection, NuGet versioning) that the team built upon. • Full-stack Development: Delivered features across the full stack — building .NET backend services and REST APIs, and developing the Angular frontend with a shared component library — and designed AI-driven analytics endpoints powering procurement KPI dashboards and real-time order bottleneck alerts. • Integration & Security: Designed integration contracts using bidirectional RESTful APIs and event-based publish/subscribe messaging for asynchronous cross-system communication, and implemented OAuth2/OIDC authentication and token handling via Auth0 across all service boundaries. • DevOps & Observability: Built multi-stage CI/CD pipelines (GitHub Actions, Azure DevOps) with quality gates, and established a structured observability strategy — metrics, distributed tracing, and structured logging with Serilog — to proactively detect degradation and meet SLA, RTO, and RPO targets. • Performance & E2E Testing: Established the automated testing strategy from the ground up — load and performance testing with k6, and end-to-end testing with Playwright — to validate reliability under load and guard critical user flows on every release. • Environment & Release Management: Provisioned and managed four isolated environments (development, staging, UAT, production), ensuring configuration parity and controlled, repeatable release promotions across every stage.
Team size	10
Technology	.NET, C#, ASP.NET Web API, Entity Framework, Next.js, Angular / TypeScript, Azure, Docker, Terraform, GitHub Actions, Azure DevOps, k6, Playwright, Auth0, PostgreSQL, Redis, Serilog, AI Agents (Cursor, Claude, Copilot).

Project Name	Tinybeans - The Photo-Sharing App That Families Love
Duration	1/2024 – 6/2025
Description	A private photo and video sharing platform for families, with millions of users worldwide. Parents use it as a digital journal and time capsule to capture milestones and share them securely with close family and friends, across iOS, Android, and web.
Position	Full-stack Developer
Responsibility	• Developed and maintained REST APIs in Java, delivering features across the core photo-sharing and family timeline services. • Built WordPress themes, plugins, and managed editorial content via WordPress VIP for the marketing and web presence of a multi-million user platform • Enforced code quality through automated reviews with Codacy and Codecov, maintaining coverage standards across the codebase • Built and deployed new releases via GitHub Actions and AWS Elastic Beanstalk, supporting continuous delivery for a live consumer product • Developed and maintained the Ember.js web application, implementing UI features for the family journal and timeline experience • Configured and maintained page layouts, redirects, and CMS content structure using WordPress and WP VIP, ensuring consistent brand presentation across the marketing site. • Integrated multi-platform payment flows: Stripe for web, Apple In-App Purchase, Google Play Billing, and TaxJar for tax calculation — supporting subscription monetisation across all platforms • Instrumented analytics and monitoring using Grafana, Sentry, Leanplum, and Braze to track system health and drive user engagement campaigns

Team size	9+
Technology	Java, Wordpress, MySQL, AWS (S3, SNS, SQS, CloudFront,...), Braze, Ember

Project Name	Proptexx – AI image generation widget for commercial real estate and interior products
Duration	1/2025 – 5/2025
Description	Developed an AI-powered image generation SaaS delivered as embeddable widgets and browser extensions for real estate and interior design websites. Clients use it to instantly regenerate property and product visuals in new styles, boosting engagement without changing their existing site infrastructure.
Position	Full-stack Developer
Responsibility	- Reverse-engineered the existing system architecture to understand integration points and onboard quickly, then connected new modules without disrupting live functionality. - Designed and built .NET API services to provision and manage per-client workspaces, acting as a middleware layer between client widget requests and the AI image generation module. - Built the browser widget frontend and admin dashboard using Vue.js 3, providing clients with an embeddable interface and operators with workspace management tools. - Integrated Outseta for subscription management, handling plan tiers, billing lifecycle, and access control for widget usage quotas. - Built background workers to synchronize data across services and process batch image generation jobs asynchronously via Redis queue. - Led and mentored a team of 4 engineers, conducting code reviews, defining technical direction, and ensuring delivery milestones were met.
Team size	4
Technology	.NET Core, Vue 3, Outseta, PostgreSQL, Redis, GCP.

Project Name	Programming Interface Module (PIM) – Precommitment Session Activation
Duration	11/2024 – 1/2025
Description	A .NET desktop module embedded in a gaming kiosk terminal, enabling players to activate and manage precommitment sessions via a touchscreen interface. The PIM communicates in real time with the central gaming system for authentication and session state, with all screen content driven remotely by the PCS portal — demanding robust inter-process communication and hardware-level reliability.
Position	Full-stack Developer
Responsibility	- Led end-to-end implementation as the sole .NET full-stack engineer on a 4-person embedded-hardware team. - Re-architected PIM from legacy codebase to the latest .NET, applying clean layered architecture, dependency injection, and unit-testable design patterns (NUnit, Jest). - Mapped the existing PCS/gaming system communication protocols and integrated the PIM module with the live terminal hardware, ensuring backward compatibility with all PCS-driven screen flows. - Built a lightweight VanillaJS frontend that renders dynamic screens in real time, driven by configuration pushed from the central PCS portal. - Containerised the application with Docker and automated deployment via GitHub Actions, enabling reliable and repeatable releases.
Team size	4

Technology	.NET Core, VanillaJS, WebSocket, JavaScript, C#, Git, Docker, Jest, NUnit, Wireshark, Postman, SOAP UI
------------	--

Project Name	Fund Management System
Duration	2/2024 – 11/2024
Description	A fund manager portal built as a module within the flagship financial management platform of an Australian fintech company. The portal gives fund managers tools to oversee investment portfolios, process transactions, and generate compliance reports — integrated with existing microservices via Kong API Gateway.
Position	Full-stack Developer
Responsibility	- Delivered full-stack features end-to-end: from backend API implementation and peer code reviews to QA testing and production deployments on Azure. - Engineered backend modules for investment portfolio and transaction management using C#/.NET, applying clean layered architecture, dependency injection, and full unit test coverage via xUnit and Moq. - Managed Azure cloud infrastructure using Terraform, ensuring consistent environments across dev, staging, and production. - Integrated with multiple internal microservices via Kong API Gateway, defining clear contract boundaries and applying separation of concerns across service layers. - Built reusable Angular base components (data tables, forms, charts) that standardised UI patterns and accelerated feature development across the portal.
Team size	6
Technology	Git, .NET, C#, Angular, TypeScript, Entity Framework, Kong Gateway, SQL Server, Moq, xUnit, Terraform, Azure

Project Name	Health care system
Duration	1/2023 – 1/2024
Description	An AI-powered healthcare platform that helps hospitals and health organizations deliver better patient care remotely. Care coordinators use it to design and assign care plans for specific patient populations. The system employs voice recognition and contextual AI to handle patient calls autonomously — answering inquiries, initiating follow-up calls, and recording health feedback — reducing manual workload and operating costs.
Position	Full-stack Developer
Responsibility	- Designed and implemented backend features and REST APIs following clean architecture principles, with structured logging and Azure Application Insights for full production observability. - Analysed the legacy system architecture, documented domain knowledge, and defined a phased migration strategy to guide the modernisation to .NET and Azure. - Built a component library in Angular that provided consistent UI building blocks for care plan screens, dashboards, and patient management views. - Provisioned and managed Azure serverless infrastructure (Functions, Service Bus, App Service), applying OAuth2 security patterns and structured observability across all service endpoints.
Team size	6
Technology	Git, .NET, C#, Angular, TypeScript, Entity Framework, Azure, Serverless

Project Name	Data Conversion
Duration	1/2023 – 3/2023

Description	A data migration tool designed to transfer records between any source and target system. The MVP focused on migrating title order data from legacy systems into a new platform, establishing the ETL foundation for a fully generic migration solution planned for end of 2023.
Position	Full-stack Developer
Responsibility	- Implemented ETL pipeline features for the MVP data migration, mapping legacy title order schemas into the new system format. - Ran integration tests against both source and target systems, conducted code reviews, and managed deployments.
Team size	5
Technology	Git, .NET, C#, Svelte, TypeScript, Entity Framework, MongoDB

Project Name	Integrated Property Tax System
Duration	3/2022 – 3/2023
Description	The process roll correction module of an Integrated Property Tax system built for a US county. The module allows tax administrators to adjust the tax roll based on assessed factors, integrates with other system modules, and generates reports and notifications for multiple stakeholder groups — covering both secured and unsecured property tax collection.
Position	Full-stack Developer
Responsibility	- Implemented tax roll correction features in C#/.NET, following clean module boundaries and writing unit-testable code with full separation of concerns. - Built and deployed REST APIs on Azure, applying structured logging (Serilog) and Azure Monitor for production observability across all tax roll processing endpoints. - Conducted code reviews, enforced coding standards, and mentored junior developers on clean code and .NET best practices.
Team size	5
Technology	Git, .NET, C#, ASP.NET Web API, Entity Framework, SQL Server, Azure, Serilog

Project Name	GIT POC – Source Codes ETL Application
Duration	9/2022 – 12/2022
Description	A WPF desktop application that automates ETL processing of source code repositories. Users configure multiple Git data sources with separate credentials, and the app handles extraction, transformation, and export of the expected results — designed as a solo-built proof of concept.
Position	Full-stack Developer
Responsibility	- Sole developer: architected, built, and shipped a WPF/.NET ETL desktop application end-to-end — from multi-source Git credential configuration to pipeline execution and structured output export. - Owned all design decisions, implemented robust error handling for unreliable Git endpoints, and managed testing and release independently.
Team size	1
Technology	Git, .NET, C#, WPF

Project Name	Modeling and visualizing the legacy system
Duration	1/2022 – 9/2022
Description	A legacy system analysis tool that extracts and models entities from existing codebases using ETL techniques, then visualizes them as interactive graphs. Developers and analysts use it to quickly understand undocumented legacy architectures and identify key components before planning a migration.
Position	Full-stack Developer

Responsibility	- Sole developer: architected and delivered the full web application from scratch, including an ETL pipeline to extract legacy code entities into a graph model stored in OrientDB. - Built an interactive visualisation UI with ExtJS Sencha, enabling analysts to navigate complex legacy architectures and dependencies at a glance.
Team size	1
Technology	Git, .NET, C#, ExtJs Sencha, OrientDb, JavaScript

Project Name	Point of Sale Desktop Application
Duration	6/2021 – 12/2021
Description	A WPF desktop POS application for retail operations, handling sales transaction processing, inventory tracking, and receipt management.
Position	Full-stack Developer
Responsibility	- Developed transaction processing, product lookup, and receipt management features for the WPF desktop POS application. - Participated in code reviews and resolved defects to maintain reliable, responsive in-store performance.
Team size	4
Technology	Git, .NET, C#, WPF
Project Name	Professional Education Management System
Duration	1/2021 – 8/2021
Description	A multi-platform education management system covering the full range of school operations — student enrollment, scheduling, grades, and activity tracking — available on web and mobile.
Position	Full-stack Developer
Responsibility	- Bootstrapped backend and frontend infrastructure from scratch, establishing project structure, CI/CD pipelines, and coding standards for a 12-person team. - Analysed and translated business requirements into technical specifications, collaborating with stakeholders to define scope and delivery priorities. - Implemented student management, scheduling, and reporting features using .NET/C# and Angular, delivering a consistent experience across web and mobile platforms. - Diagnosed and resolved defects across the full stack, maintaining system stability across web and mobile platforms for a 1,200+ student user base.
Team size	12
Technology	Git, .NET, C#, Angular, TypeScript, SQL Server

Project Name	Truck and Housing Equipment Sale System
Duration	2/2020 – 12/2020
Description	A web-based queue management system for a truck and housing equipment dealership, streamlining the sales workflow from inquiry through order processing.
Position	Full-stack Developer
Responsibility	- Built and maintained Angular/TypeScript features for the sales operation queue, implementing order status tracking and queue prioritisation logic. - Contributed to peer code reviews and resolved defects to keep the sales workflow reliable.
Team size	5
Technology	Git, .NET, C#, Angular, TypeScript, SQL Server

Project Name	Water Laboratory Management System
Duration	7/2019 – 1/2020

Description	A web application for water quality laboratories, enabling staff to manage test samples and analysis results, and share data securely with partner labs for cross-facility reporting.
Position	Full-stack Developer
Responsibility	- Developed water quality test management features using AngularJS and .NET/C#, including sample tracking, result entry, and inter-lab data sharing. - Resolved defects across both frontend and backend layers to ensure accurate, reliable test reporting.
Team size	4
Technology	Git, .NET, C#, AngularJS, TypeScript, SQL Server, VB.NET

Project Name	Back-Office Dashboard
Duration	3/2019 – 6/2019
Description	A back-office portal for a Malaysian telecommunications provider, used by internal staff to manage customer accounts, service configurations, and operational workflows.
Position	Full-stack Developer
Responsibility	- Maintained and enhanced a legacy ASP.NET WebForms back-office portal for a Malaysian telecom operator. - Implemented feature requests from internal operations teams and resolved production bugs to minimise downtime.
Team size	2
Technology	Git, .NET, C#, WebForms

Project Name	Decentralized Asset Exchange Platform
Duration	8/2018 – 6/2019
Description	A decentralized exchange (DEX) built on the Ethereum blockchain, enabling peer-to-peer trading of tokenized digital assets without a central intermediary. Solidity smart contracts enforce trustless transaction logic, with a ReactJS frontend providing the trading interface.
Position	Scrum Master & Frontend Developer
Responsibility	- Served as Scrum Master: facilitated sprint planning and retrospectives, managed the delivery timeline, and conducted blockchain product research. - Built the ReactJS trading interface and integrated it with Solidity smart contracts on the Ethereum testnet.
Team size	4
Technology	Solidity, JavaScript, ReactJs, Ethereum
